Replit Proof of Use

Project: PrepWise - Demand Forecasting and Meal Preparation Planning

Team: 牛马来西亚 | Xiamen University Malaysia

Competition: SDC Hackathon 2026, Domain 2 - Alpha Red / Orbyte Smart SME Challenge

Evidence captured: 25 October 2026, approximately 01:10-01:12 MYT (UTC+8)

How we use Replit

We use Replit as the cloud runtime and publishing platform for the PrepWise prototype. The deployed application serves its HTML, CSS and JavaScript interface together with a Python FastAPI backend. Users can open the public website, run an explicitly labelled synthetic demonstration, view preparation suggestions, approve a simulated final plan and download its CSV. The public deployment runs independently of a team member's local computer.

Observed evidence

Check	Observed result
Replit publishing status	success; public URL returned by the connected Replit service
Public health endpoint	HTTP 200; status: ok; application version: 1.0.0
API specification	HTTP 200; FastAPI title: PrepWise; 16 documented route paths
Synthetic demo	226 forecast servings; 226 suggested preparation servings
Approval result	Approved on 25 October 2026 at 01:11:19 MYT
Saved activity	submitted and approved events; identity_mode: simulated

Scope of this proof

This evidence demonstrates Replit hosting and a working synthetic demonstration. At the health check, the deployed database reported zero saved sales dates and the model status was untrained. The displayed demo uses fixed example rules, not a trained XGBoost result or real restaurant records. Approval identity is simulated. This document makes no claim of measured waste reduction, real purchasing, secure authentication, permanent cloud storage, or live Orbyte integration.

Live application evidence

These screenshots were captured from the public Replit-hosted application on 25 October 2026. The same live synthetic plan is shown in both views.

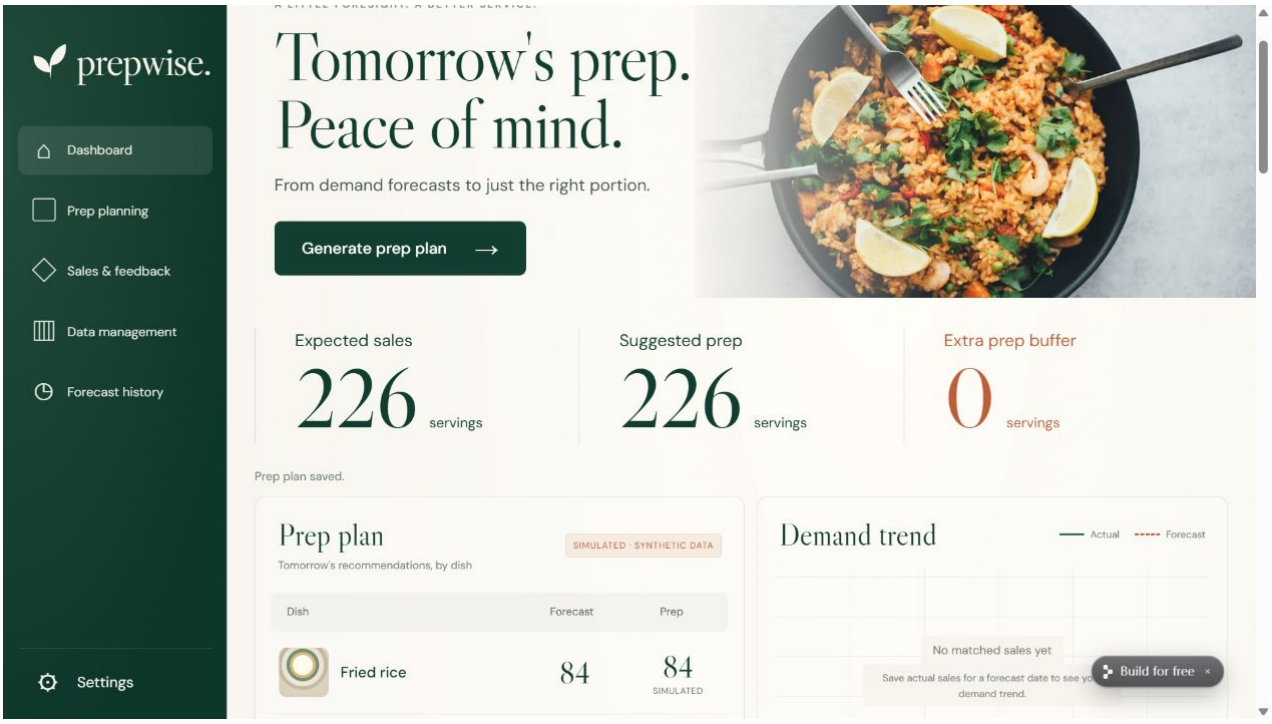

Figure 1. Public dashboard after generating a synthetic forecast: 226 expected sales, 226 suggested prep and zero extra buffer.

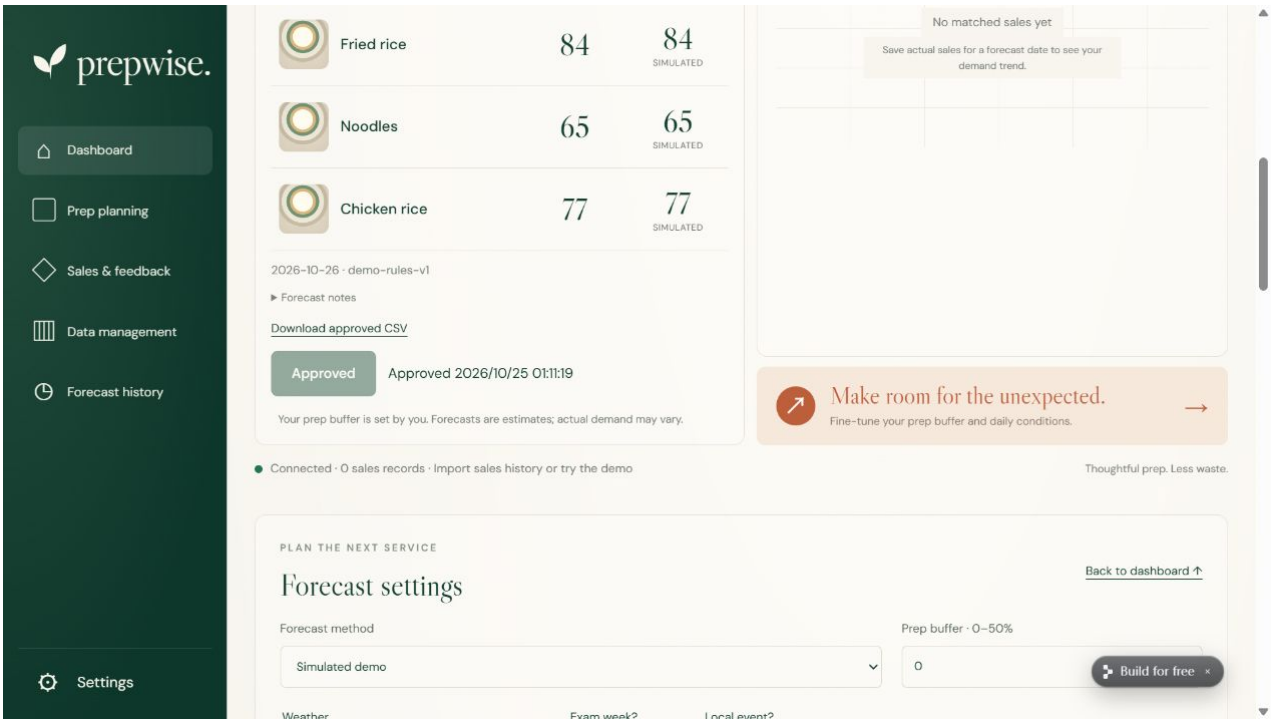

Figure 2. The same plan shows Approved, its saved timestamp and the existing approved CSV download link. Each dish remains labelled SIMULATED.

Read-only verification of the saved demo approval

The deployment and API responses were checked directly. Screenshots are actual application captures, not design mockups. No account credentials, voucher codes, billing records or real customer data are included.
